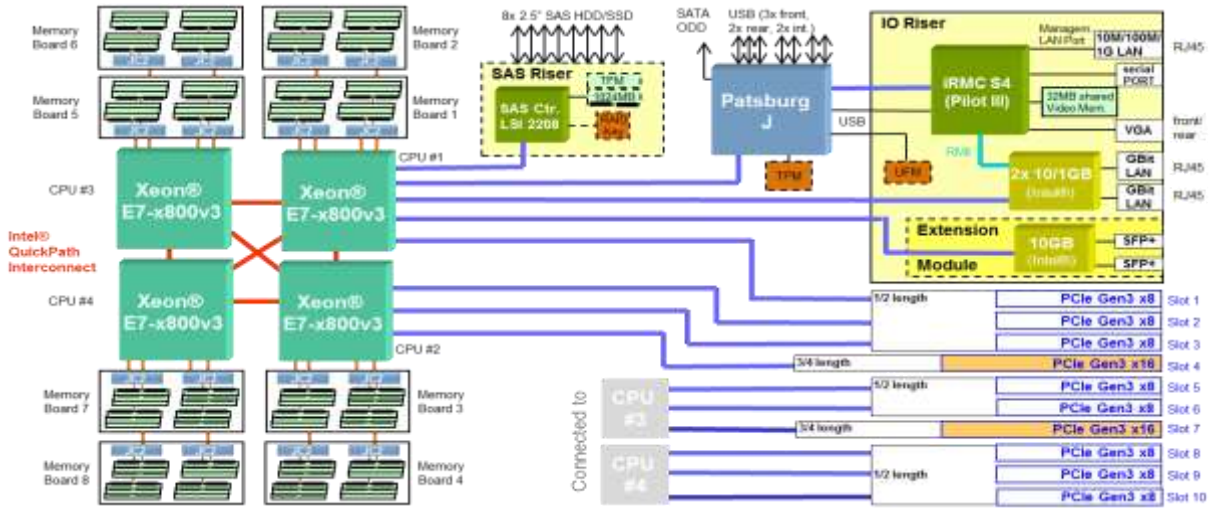
RX4770 M2 Architecture

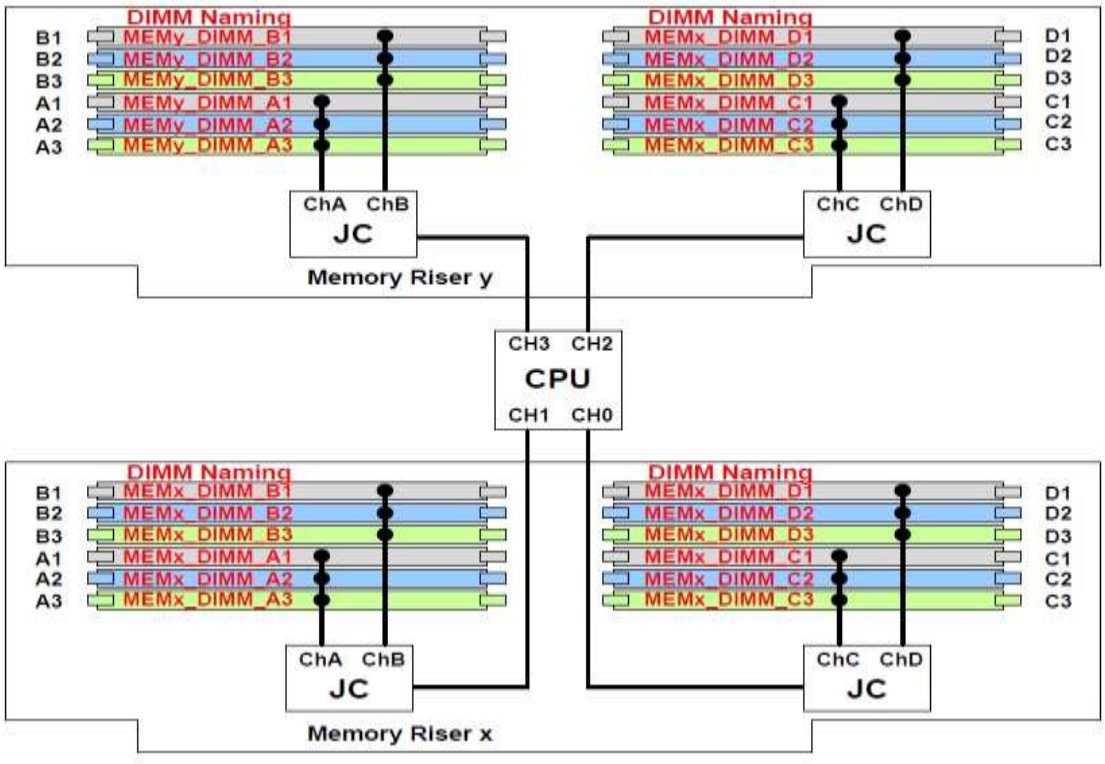


RX4770 M2 Processor Information's and Rules

Two CPU must be configured as minimum, as maximum 4 CPU´s are possible.
Empty CPU slots will be populated with CPU airflow dummy's.
Only 2 CPU or 4 CPU configurations are allowed, only same version, no mix!
Later upgrading to a 4 processor system is also possible, but may require adding of PSU and Memory modules.

RX4770 M2 Memory Information's and Rules

Basically DIMM population orders:
DIMM population order for each CPU is done by DIMM pair (2x DIMMSs) using Round Robin scheme (e.g. CPU1, CPU2, CPU3, CPU4, CPU1...)



Memory Configuration Rules (DIMM installation order)
- All DIMMs must be DDR4 DIMMs (RDIMM and LRDIMM) that support ECC. Non Buffered (UDIMMs) and Non-ECC DIMMs are not supported.
- Mixing of DDR4 operating frequencies is not validated within a socket or across sockets. If DIMMs with different frequencies are mixed, all DIMMs will run at the common lowest frequency.
- Mixing of LRDIMM with any other DIMM type is not allowed within a socket or across sockets and is not validated.
- Mixing of LRDIMM rank multiplication mode and direct mode is not supported within the same DDR4 channel. The rank multiplication factor needs to be the same for LRDIMMs on the same channel.
- Mixing of DDR operating frequencies is not validated within a socket or across sockets. If DIMMs with different frequencies are mixed, all DIMMs will run at the highest common supported frequency.
- Mixing of Intel SMI 2 Performance Mode (2:1) and Lockstep Mode (1:1) of operation is not validated within a socket or across sockets.
- DIMMs with different timing parameters can be installed on different slots within the same DDR4 channel, but only timings that support the slowest DIMM will be applied to all. As a consequence, faster DIMMs will be operated at timings supported by the slowest DIMM populated.
- When one DIMM is used, it must be populated in DIMM slot0 (farthest away from the Memory Buffer) of a given channel.
- A maximum of 8 logical ranks (ranks seen by the host iMC) per channel is allowed. Support for greater than 8 physical ranks is supported via LRDIMM rank multiplication.
- When single, dual and quad rank DIMMs are populated for 2DPC or 3DPC, always populate the higher number rank DIMM first (starting from the farthest slot), for example, first quad rank, then dual rank, and last single rank DIMM (not in 3DPC).
- Mixing of Independent and Lockstep channel mode is not allowed per platform.
- Mixing of Non-Mirrored and Mirrored mode is not allowed per platform.
- Mixing of Sparing and Non-Sparing mode is not allowed per platform.

Memory configuration modes with minimum need of DIMMs per CPU and further Stepping (see Population #):

Memory-Mode / Memory pieces	**2 CPU**		**4 CPU**

Lockstep with Mirroring	8 (4)	4 (2)	16 (8)	4 (2)
Lockstep with Sparing	16 (8)	8 (4)	32 (16)	8 (4)

Server Rules for Combination CPU and Memory Boards:
- A minimum of one Memory Board per each CPU must be populated.
- If two Memory Boards per CPU will be used, each CPU have to be populated with two Memory Boards.
- Following Configurations of CPU and Memory Boards per Server are possible:
--- Two CPU with two Memory Boards.
--- Two CPU with four Memory Boards.
--- Four CPU with four Memory Boards.
--- Four CPU with eight Memory Boards

Memory example Table for one CPU with two Memory Boards:

		5	5	5	5	6	6	6	6

Complete Memory population tables are shown in Server Manuals.

SMI2 Channel modes, Independent or Lockstep, are selectable in BIOS setup menu.

Lockstep Mode with DDR4:
- **Lockstep --> default mode**, parallel Throughput to both MEM Lines of one SMI2.
- Bus frequency ratio SMI2 to MEM Line is 1:1
- Max. SMI2 frequency are 3200 MHz, means in Lockstep-Mode **1866 MHz DIMMs can also used with 1866 MHz**
- Memory Interleaving function ate only via 2 level, required for interleaving are same - Memory capacity on DDR channels.
- **Mirror Mode or Sparing Mode can be combined with Lockstep Mode.**
- In Lockstep Channel Mode, each memory access is a 128-bit data access that spans Channel 0 and Channel 1, and Channel 2 and Channel 3. Lockstep Channel mode allows SDDC/DDDC. **Lockstep Channel Mode requires that Channel 0 and Channel 1, and Channel 2 and Channel 3 must be populated identically** with regards to size and organization. DIMM slot populations within a channel do not have to be identical but the same DIMM slot location across Channel 0 and Channel 1 and across Channel 2 and Channel 3 must be populated the same.

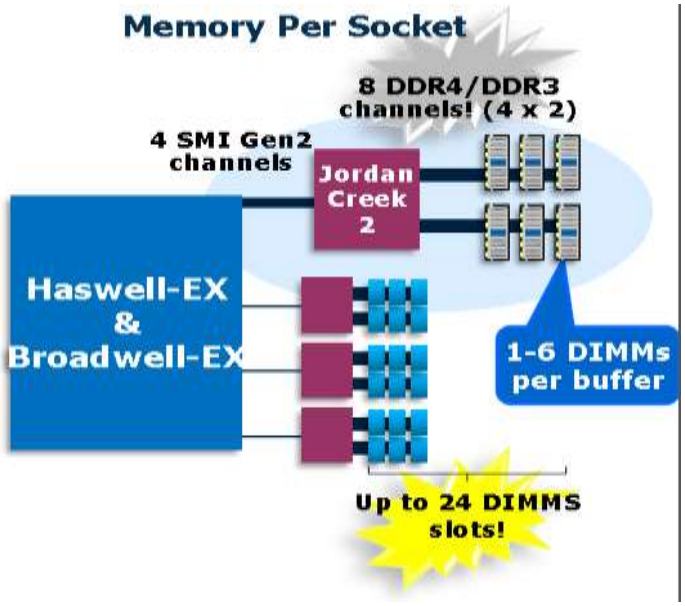
Intel Independent (Performance) Mode with DDR4:
- Bus frequency ratio SMI2 to MEM Line is 2:1
- Max. SMI2 frequency are 3200 MT/s, means in Independent -Mode fast 1866 MHz - **DIMMs can be used with Max. with 1600 MHz**
- Memory Interleaving function ate via all 3 memory level what will be **result in faster memory throughput than Lockstep Mode,** required for interleaving are same Memory capacity on DDR channels.
- **Mirror Mode or Sparing Mode can be combined with Independent Mode.**
- **Channels can be populated in any order in Independent Channel Mode**. All four channels may be populated in any order and have no matching requirements. All DDR channels must run at the same interface frequency but individual channels may run at different DIMM timings (RAS latency, CAS latency, and so forth) Independent Channel mode allows SDDC.

Max Capacity / Features
The system can be equipped with up to 96 DIMMs (distributed on 8 memory boards)
Each DIMM slot can optionally be equipped with 8GB, 16GB DDR4 RDIMM or 32GB, 64GB DDR4 LV DIMM modules, so the maximal memory size is 6144 GB with 64GB modules.

Max. Memory Speed depends on CPU QPI Speed and Memory Type, but is limited to 1866 MHz.
See also description above!

Memory Controller Independent Mode and Lockstep Mode can be switched by BIOS setup menu.
Independent Mode (higher I/O, B/W)
Lockstep Mode (highest DDR4 speeds)
Can be combined with in ordering Mirroring Mode or Spare Mode!

Memory Mirroring Mode:
In Mirrored Channel Mode, the memory contents are mirrored between SMI2 Channel 0 and SMI2 Channel 1 and also between SMI2 Channel 2 and SMI2 Channel 3. **As a result of the mirroring, the total physical memory available to the system is half of what is populated**. Mirrored Channel Mode requires that SMI2 Channel 0 and SMI2 Channel 1, and SMI2 Channel 2 and SMI2 Channel 3 must be populated identically with regards to size and organization



Memory Sparing Mode:
Sparing will be done by Rank Sparing within the same Memory Line (DDR channel).
For Ivy-Bridge Processors, Rank Sparing can be achieved if there are 2Ranks in each DDR channel.
DIMM number is unrelated.
Memory Controller on CPU can handle up to 8 logical RANKs per DDR4 channel. Requirement to configure RANK-sparing is as follows.
- In case of 1R/2R RDIMM, at least two DIMMs should be populated on the DDR4 channel.
- In case of 4R RDIMM or LR-DIMM, one DIMM population is allowed.

In Spare Mode the used Ranks as Spare Ranks shrinked the direct access able Memory:
Example: Rank Information in Memory Order Number description: xxGB (2xxxGB) **2R**x4 L DDR4-1600 R ECC

Detailed information

Min. - Max. Memory DIMM Rules:
Minimum Memory DIMM rules:
- Two Memory DIMMs are ordered with one order number, but following description will talk about DIMM pieces.
- Minimum DIMM population differenced by Memory Mode will be informed by table below.
- Because each CPU can be populated with 1 or 2 Memory Boards homogenous, for each CPU same, DIMM population on Memory Boards should be homogenous too.

Board for each CPU
- By step to two Memory Boards per CPU all CPUs have to populated with two Memory Boards.

Per CPU max. 2 Memory Boards can be installed
- with 2 CPU = max. 4 Memory boards (two included in the Base unit)
- with 4 CPU = max. 8 Memory boards
- on each CPU must be populated a minimum of Memory defined by rules of specific Memory Mode.

all SAS3.0 RAID Controllers support OOB-RAID including OOB-HDD monitoring and require no OOB-HDD cable
the OOB-HDD cable is automatically equipped for onboard or HBA Controller

Explanation PCI Slot population:
RX4770M1 can be installed 2pcs of FBUs, FBU1 and FBU2.
Normally FBU1 is for Internal RAID and FBU2 is for External RAID.

FBU cables for External RAID connection can be reached to following slots:
FBU-A: PCIe Slot 1,2,3,4 or to slot for internal RAID controller
FBU-B: Slot 4,5,6,7,8,9,10
Slot 4 is connected with CPU2, to use by External RAID w/ FBU with in 2-CPU-scoket configuration.
If no internal RAID with FBU, FBU-A can be connected to PCI Slot 1~4.
Summery:
Slot 1,2,3 : Support when no FBU for internal RAID controller Slot 4,5,6,7,8,9,10 : Support
